**README FILE FOR „Inflation Expectations and Gender Roles“**

This file contains the necessary information to replicate all results in the manuscript.

**Evaluation Software**

The software used to evaluate the data is Stata Version 17.

**Folder/File Structure**

There are four relevant folders in this repository:

- *do*: contains all the Stata
- *dta*: contains the data files including the original data (*infl_raw.dta*)
- *results*: is used to store the respective graphs and figures
- *world_map*: contains the shape files for drawing world maps with *geoplot*

**External data**

Next to the data set provided (*infl_raw.dta*), the replication package uses external data from the International Social Survey Program. The dataset (*ZA10000_v2-0-0.dta*) can be downloaded free of charge from this link:

*https://search.gesis.org/research_data/ZA10000*

The website requires registration, before the data can be downloaded. To execute the full replication package, you need to store the dataset file in the folder *dta*.

**How to replicate results**

You can replicate all results in the paper by following these steps:

1. Open the file “*1_generate_variables.do*” in the folder “*do*”.
2. Go to line 25 and change the statement “*PATH/TO/YOUR/FOLDER*” to the actual folder on your file system that contains the replication package.
3. Now execute the file “*1_generate_variables.do*” which will prepare the final dataset to perform the analysis. This dataset is stored in the folder “*dta*” under the file name “*infl_gender.dta*”.
4. Now open the file “*2_analysis.do*”.
5. Go to line 39 and change the statement “*PATH/TO/YOUR/FOLDER*” to the actual folder on your file system that contains the replication package.
6. Now execute the file, which will generate all relevant figures and regression tables. All results are stored in the folder “*results*”.
